SAFETY INFORMATION

General Safety Information

► When performing any work, all instructions given by the manufacturer and in particular the safety instructions provided in these Installation and Commissioning Instructions are to be observed. Make sure that the local standards and regulations are observed at all times.

► The CLIF-CBUSLC Interface and C-Bus controllers may be installed and mounted only by authorized and trained personnel.

► If the device housing is damaged or missing, immediately disconnect it from any power.

► If the device is broken or defective, do not attempt to repair it yourself; rather, return it to the manufacturer.

► It is recommended that devices be kept at room temperature for at least 24 hours before applying power. This is to allow any condensation resulting from low shipping / storage temperatures to evaporate.

► The CLIF-CBUSLC must be installed in such a manner (e.g., in a lockable cabinet) as to ensure that uncertified persons have no access to the terminals.

► In the case of vertical mounting on DIN rails, the CLIF-CBUSLC Interface should be secured in place using a commercially-available stopper.

► If the CLIF-CBUSLC is modified in any way, except by the manufacturer, all warranties concerning operation and safety are invalidated.

► Rules regarding electrostatic discharge should be followed.

► Use only accessory equipment which comes from or has been approved by Honeywell.

Information as per EN 60730

Purpose

The purpose of the device is: OPERATING CONTROL. The CLIF-CBUSLC is an interface device intended for HVAC in home (residential, commercial, and light-industrial) environments.

Construction

The CLIF-CBUSLC is an independently mounted electronic control unit with fixed wiring.

Mounting Method

The CLIF-CBUSLC is suitable for mounting as follows:

► in cabinets;
► in fuse boxes conforming with standard DIN43880, and having a slot height of max. 45 mm;
► on walls (using accessory MVC-80-AC1).

WEEE Directive

WEEE: Waste Electrical and Electronic Equipment Directive

- At the end of the product life, dispose of the packaging and product in an appropriate recycling center.
- Do not dispose of the device with the usual domestic refuse.
- Do not burn the device.

Standards, Approvals, etc.

Degree of Protection: IP20 (mounted on walls, with two accessory MVC-80-AC1 covers)

Refer to Code of Practice standards IEC 61000-5-1 and -2 for guidance.

The device complies with Ethernet Protocol versions IEEEC 802.3.

Overview

⚠️ WARNING

Risk of electric shock or equipment damage!
► Do not touch any live parts in the cabinet!
► Disconnect the power supply before making connections to or removing connections from terminals of the CLIF-CBUSLC
► Do not reconnect the power supply until you have completed installation.
► It is prohibited to power the CLIF-CBUSLC with the same transformer used to power controllers or other devices (e.g., the PW M-Bus Adapter).
► Observe the rules regarding electrostatic discharge.

Fig. 2. Top view

Legend
1 RS232 / RJ45 socket (for factory debugging)
2 USB 2.0 Host Interface (for connection of the IF-LON2); max. 500 mA, high speed
3 Ethernet / RJ45 socket (for SUSI communication); 10/100 Mbit/s, 1 "link" LED and 1 "activity" LED
4 Three-position slide switch (for setting bias and termination resistance of RS485-1: MUST REMAIN IN MIDDLE POSITION!)
5 RS485-1 (isolated; for C-Bus communication)
6 RS485-2 (non-isolated; DO NOT USE)
7 Future functionality
8 LEDs
9 USB 2.0 Device Interface (for connection to web browser for setup)

RS232 / RJ45 Socket
Via its RS232 / RJ45 socket, the CLIF-CBUSLC can be connected to a terminal for debugging purposes.

USB 2.0 Host Interface
Via its USB 2.0 Host interface, the CLIF-CBUSLC can be connected to the IF-LON2 External Interface Adapter and thus to LonWORKS networks. Max. 500 mA, high speed. See also section "LonWorks Communications" on pg. 19.
USB 2.0 Host Interface

Fig. 5. USB 2.0 Host interface

USB 2.0 Device Interface

The CLIF-CBUSLC is equipped with a USB 2.0 Device Interface at the front. This interface is for connection to a web browser for setting up the device.

Fig. 6. USB 2.0 Device Interface

A standard USB type-B connector can be inserted into this USB 2.0 Device Interface.

NOTE: Before attempting to connect a web browser to the USB 2.0 Device Interface of the CLIF-CBUSLC, you must first install the USB Driver on your PC. See following section "USB Driver Installation".

USB Driver Installation

Windows 7

In order to connect the CLIF-CBUSLC to the Windows 7 PC, you will need an USB cable of type A-Male-to-type-B-Male (Type B standard).

The CLIF-CBUSLC will be connected to the Windows 7 PC as shown in the following figure.

Driver Variants

Depending on the firmware version, there are two different ways to install the USB driver.

1. On most PCs, the update is done automatically with the Windows update function.
2. In the case of firmware 4.00.00 or higher, you can use the Microsoft driver from your Windows 7 installation (procedure then starts with step 17 of the following Procedure).

PROCEDURE

1. Insert the A Male connector of the USB cable into an USB interface jack of the PC and insert the B Male connector into the controller's USB device interface jack.

RESULT: The Found New Hardware Wizard is enabled in the Windows Task Line.

2. In the Windows Task Line, double-click the icon.

RESULT: The Driver Software Installation message box displays.

3. If no RNDIS/Ethernet Gadget driver was found as indicated by the message "X No driver found", click the Change setting... button.

RESULT: The Device Installation Settings dialog box displays.
4. Select No, let me choose what to do, and then select Install driver software from Windows Update if it is not found on my computer.

5. Click the Save Changes button.

RESULT: Software tries to install the RNDIS / Ethernet Gadget driver. If the driver is successfully installed, it can be seen in the following locations within Windows (see figures below):

In Control Panel \ Hardware and Sound \ Devices and Printers

In Control Panel \ Network and Internet \ Network Connections

6. If the driver has still not been successfully installed, do the following:

7. Right-click on the driver in the Network adapters folder in the Device Manager, and then click Update Driver Software.

8. Click Browse my computer for driver software.

9. Click Let me Pick from a list of device drivers on my computer.

10. Click Have Disk…

11. Click Browse… and navigate to the folder <drive:>/CARE\drivers.

12. Depending on your Windows operating system type (32-bit or 64-bit), select the RNDIS USB driver (32-bit) or the RNDIS USB driver (64-bit) file, and then click Open.

13. Click OK.

14. Select Linux USB Ethernet/RNDIS Gadget, and then click Next>.

15. If a warning message displays, click Continue Anyway. RESULT: Windows will install the driver.

16. Click Close.

17. Check the successful installation of the driver as described in step 5.

18. If this still does not work, use the driver shipped with Windows.

19. Right-click on the driver in the Network adapters folder in the Device Manager, and then click Update Driver Software.

20. Click Browse my computer for driver software.
21. Click **Let me Pick from a list of device drivers on my computer**.
22. Uncheck the Show compatible hardware box.
23. Select the Manufacturer Microsoft Corporation
24. Select Remote NDIS Compatible Device

25. Check the successful installation of the driver as described in step 5.
26. If the device status is "This device cannot start. (Code 10)", reboot your PC.

**Windows 8**
In order to connect the CLIF-CBUSLC to the Windows 8 PC, you will need an USB cable of type A-Male-to-type-B-Male (Type B standard). The CLIF-CBUSLC will be connected to the Windows 8 PC as shown in the following figure.

**PROCEDURE**
1. Insert the A Male connector of the USB cable into an USB interface jack of the PC and insert the B Male connector into the controller's USB device interface jack.
2. In Windows, start the device manager.

**RESULT:** The Update Driver Software – RNDIS / Ethernet Gadget dialog displays.

3. Click **Other devices**, then right-click **RNDIS/Ethernet Gadget** and then select **Update driver Software**.

4. Click **Browse my computer for driver Software**...
5. Click Let me pick from a list of device drivers on my computer.

7. Select Microsoft.

8. Select USB-RNDIS-Adapter, and then click Next button.
 RESULT: The Update Driver Warning message box displays.

9. Confirm the warning by clicking Yes button.
 RESULT: The driver will be installed successfully as indicated by the final message box.

10. Click the Close button.

Windows 10
In the case of controllers with firmware 4.00.00 or higher, the appropriate driver is automatically installed with a Windows update. In the case of controllers with firmware 3.04.05 or
lower, the automatic installation does not work: Please download the appropriate USB driver prior to the installation at:

Please connect the controller to the PC as described in section "Windows 8" and perform the general installation procedures for drivers in Windows 10.

**Ethernet / RJ45 Socket**
The CLIF-CBUSLC is equipped with an Ethernet / RJ45 socket featuring one LED.

---

**LEDs**
The CLIF-CBUSLC features the following LEDs:

![LEDs](image)

<table>
<thead>
<tr>
<th>symbol</th>
<th>color</th>
<th>function, description</th>
</tr>
</thead>
<tbody>
<tr>
<td>L1</td>

<td>green</td>
<td>power LED</td>
</tr>
</tbody>
</table>

See also section "Troubleshooting" on page 23 for a detailed description of the behaviors of the LEDs and their meanings.

**RS485 Interface**

**General**
The CLIF-CBUSLC has one C-Bus interface:
- RS485-1 (consisting of push-in terminals 24 [GND-1], 25, and 26) is isolated.

**RS485-1 Bias and Termination Resistors**
RS485-1 is equipped with a three-position slide switch which can be used to switch its bias resistors OFF (position "MID" - this is the default and the only allowed setting), ON (position "BIAS"), and ON with an additional 150Ω termination resistor (position "END").

---

**NOTE:**
The Ethernet / RJ45 socket is usually earth-grounded. For additional information on earthing, see also "Appendix 1: Earth Grounding" on pg. 24.
Table 6. Required slide switch settings

</tr>
</tbody>
</table>

Fig. 11. RS485-1 three-position slide switch setting MID

RS485 Standard
According to the RS485 standard (TIA/EIA-485: "Electrical Characteristics of Generators and Receivers for Use in Balanced Digital Multipoint Systems"), only one driver communicating via an RS485 interface may transmit data at a time. Further, according to U.L. requirements, the RS485 interface may be loaded with a max. of 32 unit loads. A max. of 29 C-Bus devices may be connected.

IMPORTANT
The cable length affects the baud rate. See Table 7.

Table 7. Baud rate vs. max. cable length for RS485

<table>
<thead>
<tr>
<th>Baud rate</th>
<th>Max. cable length (L)</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.6 - 76.8 kbps</td>
<td>1200 m</td>
</tr>
</tbody>
</table>

For information on wire gauge, max. permissible cable length, possible shielding and grounding requirements, and the max. number of devices which can be connected to a bus, refer to standard EIA-485.
MOUNTING/DISMOUNTING

Before Installation

IMPORTANT
To allow the evaporation of any condensation resulting from low shipping / storage temperatures, keep the device at room temperature for at least 24 h before applying power.

US requirement, only: This device must be installed in a UL-listed enclosure offering adequate space to maintain the segregation of line voltage field wiring and Class 2 field wiring.

In the case of vertical mounting on DIN rails, the CLIF-CBUSLC should be secured in place using a commercially-available stopper. See also the CLIF-CBUSLC – Mounting Instructions (MU1Z-1026GE51).

Dimensions

NOTE: Use of the covers (MVC-80-AC1) obstructs access to the Ethernet and USB 2.0 Host Interfaces and RS232 socket.
WIRING AND SET-UP

General Safety Considerations

- All wiring must comply with applicable electrical codes and ordinances, including VDE, National Electric Code (NEC) or equivalent, and any local regulations must be observed. Refer to job or manufacturer’s drawings for details. Local wiring guidelines (e.g., IEC 364-6-61 or VDE 0100) may take precedence over recommendations provided here.
- Electrical work should be carried out by a qualified electrician.
- Electrical connections must be made at terminal blocks.
- For Europe only: To comply with CE requirements, devices with a voltage in the range of 50 ... 1000 VAC or 75 ... 1500 VDC which are not provided with a supply cord and plug or with other means for disconnection from the supply having a contact separation of at least 3 mm in all poles must have the means for disconnection incorporated in the fixed wiring.

⚠️ WARNING

Risk of electric shock or equipment damage!
► Observe precautions for handling electrostatic sensitive devices.
► Do not touch any live parts in the cabinet.
► Do not open the device housing.
► Disconnect the power supply before making connections to or removing connections from terminals of the CLIF-CBUSLC and devices wired to it.
► Do not use spare terminals as wiring support points.
► To prevent risk of injury due to electrical shock and/or damage to the device due to short-circuiting, low-voltage and high-voltage lines must be kept separate from one another.
► All terminals are protected (up to 24 Vac) against short-circuiting and incorrect wiring. Higher voltages may damage the device.
► Do not reconnect the power supply until you have completed the installation.

Fusing Specifications

System Fusing
We recommend that the system be equipped with an external fuse.

Fusing of Active Field Devices
F2 (depends upon given load).

Wiring Terminals
The CLIF-CBUSLC is equipped with push-in terminal plugs.

Fusing Specifications

System Fusing
We recommend that the system be equipped with an external fuse.

Fusing of Active Field Devices
F2 (depends upon given load).

Wiring Terminals
The CLIF-CBUSLC is equipped with push-in terminal plugs.
Transformer Data
In Europe, if the CLIF-CBUSLC is powered by transformers, then such transformers must be safety isolating transformers conforming to IEC61558-2-6. In the U.S. and Canada, if the CLIF-CBUSLC is powered by transformers, then such transformers must be NEC Class-2 transformers.

**RIN-APU24**
The RIN-APU24 Uninterruptable Power Supply can be directly wired to a CLIF-CBUSLC.
See RIN-APU24 Uninterruptable Power Supply – Mounting Instructions (Product Literature no.: EN0B-0382GE51) for a detailed wiring diagram.

**Lightning Protection**
Please contact your local Honeywell representative for information on lightning protection.
SOFTWARE COMPATIBILITY
The CLIF-CBUSLC has been designed for software compatibility with the latest C-BUS devices used in CentraLine legacy projects.

The following list contains all the Building Management Systems and Integration Controllers that support full or partial integrations via CLIF-CBUSLC.

Building Supervisors
- ARENA AX 3.8.111.xx or higher*
- ARENA NX 4.2.36.34.2.11 or higher*
- ARENA 3.00.03 or higher

Integration Controllers
- HAWK300, HAWK400, HAWK600 3.8.38.44; 3.8.111.xx or higher*
- EAGLEHAWK 3.8.111.xx or higher*
- HAWK8000 4.2.36.34.2.11 or higher*
- EAGLEHAWK NX 4.4.73.24.0.18 or higher*

*CLIF-CBUSLC assumes an installed C-BUS driver on AX or NX Building supervisors or Integration Controllers.

Table 12 lists the compatible controller versions supported by the current CLIF-CBUSLC release:

CLIF-CBUSLC FIRMWARE UPDATE
1. Connect PC with the CLIF-CBUSLC using a USB cable. (The Ethernet port of the CLIF-CBUSLC cannot be used for firmware update.)
2. Open your browser and enter the following network address: 192.168.255.241.
3. Log in with your password.
4. Click on the Firmware button.
5. Select Firmware .xwa File: and choose the firmware you want to download.

CLIF-CBUSLC Firmware

| firmware_version=BNAC_1-00-03-02 |
| xwsystem_version=2-00-01-08 (29-06-2018) |
| uboot_version=UBSCUBOOT_2-00-02-00 |
| linux_version=UBC-Linux_2-00-05-15 |
| sku_number=CLIF-CBUSLC |
| serial_number=001C8495 |

6. Click on the Load Firmware button.
7. After about 75 seconds, the web page shows the name of the downloaded file and the flash process begins.
8. The update process will take another approximately 3 minutes. After a while, the red LED will light up. When the red LED goes dark, the update is finished. It is now again possible to access the web page.
ENGINEERING, COMMISSIONING

Please refer also to ARENA<sup>AX</sup> / COACH<sup>AX</sup> – User Guide
(Product Literature No.: EN2Z-0996GE51) and the CentraLine
NX LonSock RNI Driver – User Guide (EN2Z-1054GE51) for
detailed information.

Required Preparations

In order to access (with a laptop or PC) the CLIF-CBUSLC via
Ethernet/IP for the first time, a password must be defined. For
setup, you must connect a PC with a web browser to the USB
2.0 Device interface as described below.

USB 2.0 Device Interface

This USB 2.0 Device interface is the interface for setting up
the communication settings and downloading new firmware.
An "A-Male to B-Male" USB cable is required.

For access via USB, the CLIF-CBUSLC has a permanent
default IP address 192.168.255.241.

Set-Up

After removing the CLIF-CBUSLC from its shipping box,
attach power and wait approx. 1 minute while it powers up.
During power-up, the red warning LED (see Fig. 9 on pg. 10)
will be lit. As soon as this warning LED goes dark, you may
commence with the set-up, as follows:

1. Connect one end of the A-male to B-male USB cable (see
   Fig. 18) to your PC and the other end to the USB 2.0
   Device Interface (see Fig. 6 on pg. 6) located on the front
   of your CLIF-CBUSLC.

   An initial mask will then appear on the screen of your PC.

3. When setting up your CLIF-CBUSLC for the first time, you
   will have to enter an administrator password. This
   administrator password must contain:
   - 8 or more (but not more than 31) characters
   - uppercase letters
   - lowercase letters
   - numerals
   - no whitespace characters

4. A login mask will appear. You may now login using the
   administrator password.

5. Press the CONFIGURATION button.

6. The configuration mask (see Fig. 19) will then appear.
   Settings for the following connection options will be
   requested there:
   - Physical C-Bus
   - C-Bus over LonWorks (virtual C-Bus)
   - Standard LonWorks (requires Niagara 4.4 or higher
     and NX LonSock RNI Driver – file name
     "lonsockClient-rt.jar"

7. Settings in section "Ethernet settings" are valid in general
   for all three options. Enter the IP address, subnet mask
   and default gateway address. Do not select "block
   SUSInet port" as this is needed only if you want to tunnel
   SUSInet communication over ssh.

8. Section "Physical C-Bus" lists the specific settings for
   option "Physical C-Bus".
   If you want your interface to synchronize the time of your
   bus devices on an hourly basis, select "work as time
   master. Setting "default token passing mechanism" allows
   the selection "automatic, ring (for COV mechanism) or
   star (for polling mechanism)". This may be overridden by
   the Supervisor

9. Settings in section "LON settings" are valid in general for
   the two LonWorks options. Enter the communication
   parameters "subnet, node and domain". You can retrieve
   this information from the engineering tool.
   Setting "neuron ID" can’t be modified. It is read from the
   LON interface IF-LON2.
   The prerequisite for this is that the IF-LON2 LON interface
   has been connected to the CLIF-CBUSLC’s USB 2.0 Host
   Device interface using the IF-LON2’s micro USB cable.

10. If you are using the "C-Bus over LonWorks" option, you
    must also enter the bus ID in section "C-Bus over LON".
    The bus ID must be the same for all devices connected to
    the C-Bus. The default is "1".
    If you want your interface to synchronize the time of your
    bus devices on an hourly basis, select "work as time
    master".

11. For option "Standard LonWorks", select "work as RNI
    driver in section "Standard LON". This enables Standard
    LonWorks access via CLIF-CBUSLC.

12. Press "SAVE CONFIGURATION". When you are done,
    you may log out or go back to the status display.
CLIF-CBUSLC Configuration

### LON Settings
- subnet:
- node:
- domain:
- neuron ID:

### C-Bus over LON (USB / IF-LON2)
- bus ID: (default = 1)
- work as time master:

#### NOTE:
Regarding time master functionality, the CLIF-CBUSLC does not observe daylight saving time. If your controllers do observe automatic daylight saving time, we recommend that you not use the time master functionality. If there is a local workstation permanently on the bus, we recommend that this workstation should be responsible to synchronize date and time.

#### NOTE:
If you wish to use the CLIF-CBUSLC as a Standard LonWorks interface for Niagara, the same subnet, node, and domain which you configure in the CLIF-CBUSLC configuration mask (see Fig. 20) has to be set in Niagara workbench. You must therefore enter the same domain in the Property Sheet next to "Lon Netmgmt". Specifically, change the length from its default ("0") to "1", "3", or "6", as the case may be. The "Id" box will then appear (see Fig. 20), into which you should then enter the ID of the domain as defined in the CLIF-CBUSLC configuration mask.

LONWORKS COMMUNICATIONS

General Information

The CLIF-CBUSLC can be connected to LonWorks networks. This requires the use of an IF-LON2 (see section "IF-LON2" below), which is then plugged into the CLIF-CBUSLC's USB 2.0 Host Interface (see also section "USB 2.0 Host Interface" on pg. 5).

This permits individual CLIF-CBUSLC Interfaces to be connected / disconnected from the LonWorks network without disturbing the operation of other devices.

The LonWorks network is insensitive to polarity, eliminating the possibility of installation errors due to miswiring.

Different network configurations (daisy-chain, loop, and star configurations, or any combination thereof) are possible. See also Excel 50/500 LonWorks Mechanisms Interface Description (Product Literature no.: EN0B-0270GE51).

Connecting to a LonWorks Network

**IMPORTANT**

Do not bundle wires carrying field device signals or LonWorks communications together with high-voltage power supply or relay cables. Specifically, maintain a min. separation of 3 inches (76 mm) between such cables. Local wiring codes may take precedence over this recommendation.

**IMPORTANT**

Try to avoid installing in areas of high electromagnetic noise (EMI).

Cable Types

The unit must be wired to the LonWorks network using either

- level IV 22 AWG (Belden part number 9D220150)
- plenum-rated level IV 22 AWG (Belden part number 9H2201504) non-shielded, twisted-pair, solid-conductor wire.

When possible, use Honeywell AK3781, AK3782, AK3791, or AK3792 cable (US part numbers). See Excel 50/5000 LonWorks Mechanisms (Product Literature no.: EN0B-0270GE51), for details, including maximum lengths.

Use wire with a minimum size of 20 AWG (0.5 mm²) and a maximum size of 14 AWG (2.5 mm²).

IF-LON2

Optionally, communication with physical I/O modules, with room and zone controllers, and with CentralLine PANTHER, TIGER, and LION controllers can utilize LonTalk.

The IF-LON2 is equipped with a free-topology transceiver (FTT10A) for communication (at a data transmission rate of 78 Kbaud) on LonWorks® networks (using the LonTalk protocol).

The LonWorks network is insensitive to polarity, eliminating the possibility of installation errors due to miswiring. Different network configurations (daisy-chain, loop, and star configurations, or any combination thereof) are possible. See Excel 50/5000 LonWorks Mechanisms (Product Literature no.: EN0B-0270GE51) for details.
C-BUS CONNECTION
The CLIF-CBUSLC features an RS485 interface to which C-Bus devices can be connected: RS485-1 (consisting of push-in terminals 24 [GND-1], 25, and 26).

C-Bus Topologies
Via the C-Bus, up to 30 C-Bus devices (e.g., controllers, etc.) can communicate with one another and a PC central. The C-Bus must be connected via the individual controllers (open ring).

NOTE: Star connection is not allowed, as this might cause uncontrollable line reflections.

Instead of CLIF-CBUSLC Interfaces, C-Bus controllers (e.g., the Excel 500, Excel 100, LION, PANTHER) can also be connected.

![C-Bus topology Excel 5000](image)

C-Bus Cables

**NOTE:** Observe national regulations for C-Bus cables!
For Europe: only shielded cable is permitted.
For the U.S., shielded or unshielded cable can be used.

<table>

Table 14. C-Bus cable types
Connecting CLIF-CBUSLC via RS485-1 to C-Bus

NOTE: Always power each CLIF-CBUSLC and the connected C-Bus devices via separate transformers.

NOTE: The max. C-Bus cable length is 1200 m (4000 ft).

NOTE: If any devices are not electrically isolated, signal ground connection is recommended. See section "RS485 Standard" on pg. 11.

NOTE: If the CLIF-CBUSLC is connected at either of the line's two ends, an additional termination resistor (RT = 120 Ohm) is necessary.

NOTE: Regardless of the position of the CLIF-CBUSLC along the C-Bus, the 3-position switch must be set to MID.

Example: CLIF-CBUSLC and Connected C-Bus Devices

![Diagram of CLIF-CBUSLC and Connected C-Bus Devices]

* This corresponds mainly to the no. of datapoints in trend if these datapoints do not update faster than once per minute. In the case of physical C-Bus systems, the update rate of each datapoint can be influenced by the user (i.e., by changing the attribute "trend hysteresis").
TROUBLESHOOTING

General
The following LEDs of the CLIF-CBUSLC can be used for troubleshooting purposes:

- Power LED (green)
- Status LED (red)
- L2 LED (yellow)
- Tx (sending data on RS485-1) and Rx (receiving data on RS485-1) LED

<td>Tx is flashing and Rx is OFF</td>
<td>The CLIF-CBUSLC is attempting to establish communication on RS485-1, but there is no answer.</td>
<td>➤ The communication rate (Kbaud) on RS485-1 has not been correctly set; controllers on the C-Bus may have been setup incorrectly; wiring problem or hardware defect.</td>
</tr>
</tbody>
</table>
APPENDIX 1: EARTH GROUNDING
CLIF-CBUSLC and SELV
In order to avoid distribution of noise or earth ground potential differences over networks or other connections, the CLIF-CBUSLC is designed to be in compliance with SELV (Safety Extra-Low Voltage).
Furthermore, SELV offers the greatest possible safety against electrical impact.
To support SELV, all Honeywell external (CRT series) or internal transformers comply with standard EN60742.
Earth grounding is therefore not recommended.

CLIF-CBUSLC and Standard EN60204-1
However, if compliance with EN60204-1 is required, note the following:

General Information about EN60204-1
EN60204-1 defines electrical safety for a complete application / machine including controllers, sensors, actuators and any connected/controlled electrical device.
EN60204-1 requires controllers to be powered by PELV (Protective Extra-Low Voltage) and earth grounding of the secondary side of the used transformers or earth grounding of the system ground.
Earth grounding is prescribed to prevent unexpected start-up of connected rotating/moving machines due to an insulation fault and double earth grounding somewhere in the plant.
In order to fulfill PELV (if earth grounding is prohibited), the use of an earth leakage monitor is also possible.

When is EN60204-1 Applicable to CLIF-CBUSLC Systems?
- Safety against electrical impact
  - EN60204-1 is not mandatory; this is because electrical safety is provided by the use of SELV and transformers according to standard EN60742.
- Safety against unexpected start-up of rotating/moving machines
  - If the application/plant does not contain machines that can be harmful to the operator due to an unexpected start-up, the standard EN60204-1 is not applicable.
If such machines are encountered, then EN60204-1 must be followed. Grounding is required.

Earth Grounding of EN60204-1 Applicable Systems
NOTE: Our recommendation is that each CPU be supplied with electricity from its own dedicated transformer.

- If system protective earth grounding is planned, use a cable as short as possible for grounding: min. 1.5 mm² (16 AWG).
- For connection details, refer to the following examples.

Example 1
The following explains how to connect and earth multiple CPUs (e.g., multiple CLIF-CBUSLCs, PANTHERs, TIGERs, LIONs, etc. or any combination thereof) earth-grounded as per EN60204-1.
NOTE: Use a noise-free earth ground inside the cabinet.
NOTE: If a field device that prohibits earth grounding is connected to the system ground, an isolation monitoring device must be used instead of earth grounding.

- Connect earth ground to the respective terminal of the CPU, see Fig. 26.

Fig. 25. Connecting and earthing multiple CPUs
(RECOMMENDED USE OF SEPARATE TRANSFORMERS)
Example 2
When connecting multiple CPUs to a single transformer, it is imperative that the polarity of the power supply terminals of the CPUs and the polarity of the transformer always correspond (namely: 24V-0 of the transformer must always be connected to 24V-0 of the CPU, and 24V~ of the transformer must always be connected with 24V~ of the CPU). Depending upon the individual CPU, the numbering of the corresponding two terminals may possibly deviate from the norm (which is usually "terminal 1 = 24V-0" and "terminal 2 = 24V~"). In the following example, CPU 3 has a deviating numbering and must be connected accordingly.

**NOTE:** When using a single transformer for several CPUs, each CPU ground must wired separately to the star-point.

**NOTE:** If the field device transformer is physically far away from the CPUs, earth grounding must still be performed for the controller.

**NOTE:** Use one star-point to split power for multiple CPUs and field devices.

► Connect earth ground to the proper terminal of the CPU.
